

Yarn Feed Variator

- Electronic variation of eccentric disc pattern attachment
- Small pattern effects by addition and subtraction of yarn
- Ideal for use with beams

Yarn Feed Variator

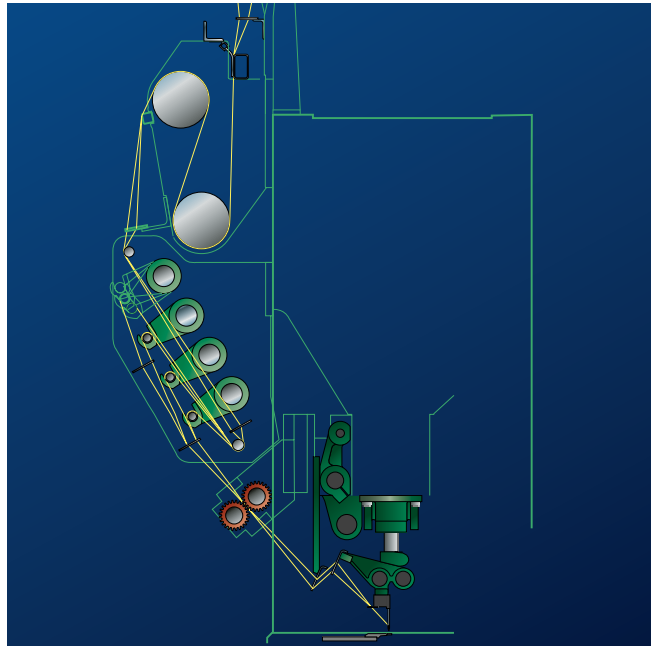

The Yarn Feed Variator is a new innovation from Cobble, comprising a series of rollers. It is an electronic variation on the well-known eccentric disc pattern attachment (nicknamed 'Mickey Mouse'), which is able to give a more flexible patterning approach.

It produces small pattern effects by adding or subtracting yarn from a continuous supply using oscillating guides controlled by servo motors. Since it is fed via feed rollers it is ideal for use with beams.

The Yarn Feed Variator represents only one of a number of functions which can be servo controlled in order to achieve imaginative and original results.

As the demand for new and more sophisticated patterning systems has developed, the Yarn Feed Variator highlights Cobble's ability to respond, drawing from a wealth of experience in refining patterning attachments.

Additionally, in relation to patterning attachments, servo control can be utilised on two and three pile height Full Repeat Scroll, and Multi Roll, to produce innovative end product. These attachments can often attain fuller potential when used in conjunction with single and double sliding bar. All can be offered with the most advanced Computer Aided Design System.
